

COPPER + LIQUID SULPHUR AND BORON FERTILIZER, 300 G

Code: 1333321

EC Fertilizer

COMPOSITION

Flowing mixture of micronutrients based on copper sulphate (Cu) 8, sulphur (S) 20, boron (B) 0.5

FORMULATION

liquid paste

PACKS

300 g bottle

Florlis®

Charateristics

foliar fertilizer based on boron, copper and sulphur to prevent and control the deficiencies of these nutrients in the plants. Copper is an essential element for the life of all plants: it is a constituent of important enzymes, is necessary to the photosynthesis and helps to stimulate the natural defences of the plants from pests. Sulphur participates in the formation of proteins being a basic constituent of 2 essential amino acids (cystine and methionine). Copper and sulphur together improve the physiological state and strengthen the natural defences of the plants from stress caused by numerous fungi (oidium, scab, mildew, rust etc.). Finally, boron improves the fertility of the flower increasing the vitality of the pollen. This turns into a greater fertilization that leads to a higher production of fruits. The particular formulation in flowable gel ensures a high wettability, adhesiveness and assimilation through the cuticle of the three elements by the plant. Moreover it ensures the absence of powder when preparing the solutions and a greater miscibility and compatibility with other products.

How to use

shake well before use. Foliar treatment: dilute 10-15 ml in 5 litres water for 50 m2. Sprinkle the plants trying to get a complete and homogeneous wetting. Repeat the treatments in case of heavy rain. DO NOT TREAT DURING BLOOM.
